TITLE: Vibration of a liquid-filled spherical shell

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 1, 1966, 38-46

TOPIC TAGS: vibration, spheric shell structure, centrifugal force, oscillograph, resonance phenomenon, vibration theory

ABSTRACT: The authors study axisymmetric vibrations of a spherical shell for two general cases: 1. when the lower and upper hemispheres are of the same thickness; 2. when the upper and lower hemisphere thicknesses are different. A spherical shell is assumed to be composed of two hemispheres. The hemispheres are fixed in a diametric plane away from centrifugal forces and unrestricted with respect to normal motion. It is assumed that each hemisphere can move stepwise in any direction along the normal. This model may be used within the framework of momentless theory to describe antisymmetric vibrations with respect to the given plane. A liquid filled sphere was fastened to a vibration stand by means of a socket. Eight transducers were attached to the shell to determine vibration amplitude. The signals were then amplified and recorded by a loop oscillograph. In addition to this, the amplitude was measured by a

Card 1/2

vibration pickup in the form of a thin plate with transducers. The plate was then fastened to a fixed support. These signals were also amplified and recorded by a loop oscilloscope. Natural frequencies and configurations were determined by a resonance method. The calculations are in agreement with experimental data. Orig. art. has: 4 figures, 2 tables, 43 formulas.

TITLE: Working model to simulate motion of an artificial earth satellite. Class 42,  
No. 147845

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 23, 1966, 208

TOPIC TAGS: model, artificial earth satellite, astronomy, satellite motion

ABSTRACT: This Author's Certificate introduces: 1. A working model which simulates motion of an artificial earth satellite. The unit contains a globe and a model of the satellite on a bracket rotated by individual electric drives. The model has a replaceable template with a guide slot to simulate an elliptical orbit and rotation of the major semiaxis in the orbital plane. This template is fastened to the gear in the speed reducer of the satellite drive which is coaxial with the output half-axle of the speed reducer. The model is also furnished with a cantilever extension of the satellite bracket with a pin which moves in the slot of the template for reciprocating motion of the bracket simultaneously with its rotation. 2. A modification of this model in which the rate of motion of the satellite is varied at perigee and apogee to conform with Kepler's law of constant sectoral velocity. A variable resistor is mounted on the cantilever extension and connected to a control circuit with the sliding contact coupled to the output half-axle of the speed reducer.

TITLE: Production and some properties of the semiconductor compounds  $ZnSnP_2$  and  $CdSnP_2$

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 2, no. 11, 1966, 1966-1969

TOPIC TAGS: zinc containing alloy, tin containing alloy, cadmium containing alloy, phosphorus containing alloy, semiconductor alloy

ABSTRACT: Previous attempts to obtain  $ZnSnP_2$  from a mixture of components taken in stoichiometric ratio yielded a product containing a mixture of phases, including the ternary compound  $ZnSnP_2$ , but also zinc and tin phosphides. The present article describes a method for producing single phase  $ZnSnP_2$  by crystallization from a dilute solution in tin. The initial weighed portion consisted of zinc, tin, and phosphorus, in which the tin was taken in large excess over the stoichiometric amount. After heating to a temperature of  $870^{\circ}C$  and slow cooling in an evacuated quartz ampoule, the

Card 1/2

UDC: 537.311.33

ACC NR: AP6036786

ZnSnP<sub>2</sub> was separated from the tin. The remaining thin film of tin on the ZnSnP<sub>2</sub> crystals was dissolved in concentrated nitric acid. The crystals of ZnSnP<sub>2</sub> were a dark gray color, and were 3 x 1, 5 x 0.5 mm in size. Analogous experiments with CdSnP<sub>2</sub> showed that it could be produced from a dilute solution in cadmium. X ray analysis of the compounds obtained made it possible to determine the type of crystal structure, the lattice constants, and the microhardness; these values are listed in tabular form. It was shown also that ZnSnP<sub>2</sub> has a considerable amount of chemical resistance to a number of mineral acids, including nitric, hydrochloric, sulfuric, and hydrofluoric, while CdSnP<sub>2</sub> has very little resistance to these acids. Orig. art. has: 1 figure and 2 tables.

Cybernetic methods of technical diagnosis (Kiberneticheskiye metody tekhnicheskogo diagnoza) Moscow, Izd-vo "Mashinostroyeniye", 1966. 149 p. illus., biblio. 5,000 copies printed.

TOPIC TAGS: <sup>mechanical</sup> cybernetics, engineering ~~diagnosis~~, acoustic diagnosis, ~~engineering diagnosis theory~~, ~~engineering diagnosis methods~~, quality control, reliability engineering

PURPOSE AND COVERAGE: This book is intended for mechanical engineers concerned with the reliability of machines. The author discusses the general theory and methods of engineering diagnosis and the principle of designing cybernetic devices for determining the condition of machines without dismantling them. These methods and instruments may be used in the quality control of manufactured machinery in determination of the maintenance and repair procedures during the operation period, and also in conducting scientific investigations. There are 38 references, 33 of which are in Russian.

AUTHOR: Pavlov, B. V.

TITLE: The upper limit of self-ignition in a nonbranching chain reaction

SOURCE: AN SSSR. Doklady, v. 162, no. 4, 1965, 873-874

TOPIC TAGS: combustion, ignition, reaction kinetics, propulsion, ignition limit, chain reaction

ABSTRACT: Since according to Frank-Kamenetskiy's theory of thermal explosion the conditions for self-ignition of a homogeneous gas mixture can only improve with increasing pressure, it appears that the existence of an upper limit of self-ignition must be due to a chain reaction mechanism. The conditions of ignition by a non-branching chain reaction were analyzed by formulating and solving expressions for the radical concentration and temperature profile in a spherical vessel and the radical concentration at the wall. The following criterion for self-ignition was derived:

$$w_{r,0} \frac{E}{RT_0^2} > \frac{\mu_r^2 \lambda}{4 p^2}$$

where  $w_{r,0}$  = the reaction rate close to the wall, E = activation energy,  $T_0$  = temper-

ature

L 10231-65

ACCESSION NR: AP5015429

nature of the wall,  $\mu_1$  = first root of a Bessel function,  $\lambda$  = thermal conductivity,  $\rho$  = thickness of the reaction layer,  $q$  = heat of reaction, and  $R$  = gas constant. Since  $\rho \propto p^{-3/2}$ , the reaction layer thickness decreases with increasing pressure, and the expression on the right side of the criterion increases until both expressions are equal and ignition does not take place. This mechanism is the physical basis for the upper ignition limit. Orig. art. has: 10 formulas. [PV]

PURPOSE: This book is intended for scientists in the field of semiconductor physics, solid state spectroscopy, and semiconductor devices. The collection will be useful to advanced students in universities and institutions of higher technical training specializing in the physics and technical application of semiconductors.

GOVERNING: The collection contains reports and information bulletins (the latter are indicated by asterisks) read at the First All-Union Conference on Optical and Photo-Electric Phenomena in Semiconductors. A wide scope of problems in semiconductor physics and technology are considered: photoconductivity, photoelectromotive forces, optical properties, photoelectric cells and photoresistors, the actions of hard and sharp-sacular radiations, etc. The materials were prepared for publication by E. I. Razibov, O. V. Snitko, K. B. Tolpygo, A. P. Labchenko, and M. K. Shremman. References and discussion follow each article.

REF ID:	Kololyats, S. T., Soviet of Technical Sciences	
TYPE:	The Investigation of Vitreous Semiconductor (Inhalogeny stableborazul polyprenovite)	
PERIODICAL:	Vestnik Akademii Nauk SSSR, 1959, No 2, pp 103-104 (USSR)	
ABSTRACT:	From December 1 to 2, 1958 a conference took place on the problem of the Metal-oxihalidegally Lanthanides and USSR (Physicochemical Institute of the Academy of Sciences, USSR). In detail with the discussion of the experiments carried out, mutual information on the sequence of experiments and their general conclusion. Representatives from 11 scientific institutions attended the conference. The following lectures were held: V. V. Goryainov, Institute of Mineralogical and Petrographical (Korolev Chemical-Mechanical Institute) spoke of experimental results connected with the investigation of heat capacity at low temperatures of $A_2Si$ and $A_2Ge$ . His work report dealt with the polymorphic concept of glass formation and solidification in general.	
	R. I. Brailov, Gomel' University optoelectronics institute (State Optical Institute) emphasized the decisive role played by the silicon bond in glass formation.	
	A. I. Oshane and V. M. Dzerikyan, Physics-technological Institute (Physicochemical Institute) reported on theoretical problems of the semiconductor properties of glass types. V. A. Shchegoleva, Institute of Glass Chemistry of the AS USSR) described the investigation of the structure of the system $As_2O_3-SiO_2$ by X-ray methods.	
	I. I. Sharikov, Institute Kristallurgicheskikh Materialov (Khimz) reported on the AS USSR) reported on the structural investigation of some chalcogenides by electron-diffraction.	
	A. I. Oshane and V. M. Dzerikyan, Physics-technological Institute (Physicochemical Institute) reported on theoretical problems of the semiconductor properties of glass types. V. A. Shchegoleva, Institute of Glass Chemistry of the AS USSR) described working results in the determination of boundaries as glass formation in the $As_2O_3$ and $As_2Ge$ systems.	
	B. A. Sosulin compared the boundaries of vitreous state in these systems with the criteria of glass formation obtained by Schatzkes and Vinter-Kleyn and found that there exists no correlation between them.	
	S. I. Blinov investigated the electric properties of semiconducting glass type in the $SiO_2 - As_2O_3$ system.	
	P. Yu. Moloboyev reported on the research work in the field of laser parametric effects done by P. I. Kostovitsa.	
	P. Yu. Moloboyev discussed experimental results of the position of the boundary as dependent on the change of composition of glass type.	
	V. P. Nekrasov reported on material he obtained in the investigation of the viscosity of glass type in the $As_2O_3 - As_2Se$ system.	
	B. Z. Kololyats summarized the working results obtained by the Physicochemical Institute and found that in the materials investigated the short-range order is not changed in the transition from the vitreous into the crystalline state.	
	G. I. Matveichuk, Leningradsky khimicheskoye zavodnoye (Leningrad Chemical Plant) described the investigation of the semiconductor properties of silicate and borosilicate glass type with the addition of indium and titanium oxides.	
	P. V. Palentsev, Moscow Institute of Electrotechnicheskogo stekla (Moscow Institute of Electrochemical Glass) outlined the investigation results of the boundaries of glass formation and the electric properties of continuous semiconductor glass type of the composition $2O_3 - P_2O_5 - Al_2O_3$ (A - elements of the Ia, II, III, IV and V groups of the periodic system).	
	The next conference on glass-conductor glass types will probably be held in 1959.

Soviet-U.S.S.R Conference on the Vietnamese State  
Bucharest, 1960. Nr 3, pp 43-45 (RSNI)

**TYPE:** 3rd All-Soviet Conference on the Vietnamese State  
**ARRANGERS:** The 3rd All-Soviet Conference on the Vietnamese State was held in Bucharest at the end of 1959. It was organized by the Central Scientific Research Institute of the Ministry of Chemical Industry of the USSR (Institute of the Chemistry of Silicates (Institute No. 1), Vsesoyuznoye Naukno-tekhnicheskoye obshchestvo nauchno-tekhnicheskoy i tekhnicheskoy promstsvy (All-Soviet Chemical Society) (Institut Nauk S. I. Vavilova and Gosudarstvennyy opticheskyy institut (Institut S. I. Vavilova), more than 100 (State Optical Institute (Institut S. I. Vavilova), more than 100 reports on the structure of glass, investigation methods of the structure of glasses, classification and physicochemical properties of glasses, the synthesis of glasses delivered. The Conference was opened by Ambassador A. A. Lebedev.

At the 3rd meeting, 9 reports dealt with the investigation results of sodium-barium-silicate glasses, barium and calcium, barium-aluminum-silicate glasses, barium and calcium glasses, "Barium Glass" (Ye. I. Golikov, "On the Coordination Number of Barium and Potassium in Some Glasses"), S. P. Klyushnikov reported on structural changes in boron-silicate glasses. T. A. Klyushnikova reported on some controversial problems concerning the structure of borosilicate glasses and their properties (Zhukovskii, G. P.). Professor V. S. Andreev, "Substitutional Reactions in the Structure of Complex Glasses". The 15 reports all

concerned with the electrical properties of glasses. L. S. Polyakova reported on the structure determination of glass with the aid of an inhomogeneous electric field. B. M. Tret'yakov, V. I. Chashin and V. I. Olevitsky, "Structure and Properties of Some Optical Glasses in the Light of the Polymer Theory" and the discussion of dissociation. N. I. Drorilov reported on the ability and the degree of dissociation of the bonds and chemical composition of the glass. V. I. Olevitsky reported on the nature of dielectric losses in glasses and crystalline aluminosilicates. V. P. Kerecova, "Investigation of the Dielectric Properties and the Possibility to Prepare Glass", V. A. Zemcov, V. I. Chashin and N. I. Drorilov reported on the conductivity of glasses in the temperature range of 200-1000°C. V. I. Olevitsky reported on investigation of the conductivity of glasses in the temperature range of 200-1000°C. V. I. Olevitsky reported on the dissociation of high-silica glasses. V. L. Ternovskiy on the dissociation of glass and its influence on glasses. A. Dofra, N. N. Tchubareva and G. I. Throsterko on electric properties of crystalline glasses and crystalline aluminosilicates. D. V. Fazurin spoke on his studies which were carried out under the supervision of Professor B. V. Yerushkevich at the Institute of Inorganic Materials (Institut Neorganicheskikh Glassov) of the Leningrad Technical Institute (Institut Neorganicheskikh Glassov). The 7th meeting, 6 reports deal with glasses and conductors, 9 with the behavior of glasses and the influence of radiation and 4 reports with technical properties of glasses. A. A. Kalyanov, T. V. Molonova, M. A. Sviridova and L. P. Shul'ko reported on the dependence of the electrical properties of glasses on the chemical composition. T. A. Kharlamov, O. V. Kursant and J. N. Slobodkin gave a presentation report on the specific electrical conductivity of glasses in the temperature range of 200-300°C - 500-600°C in the temperature range of 400-1000 and on the influence of addition of aluminum and zinc oxide on the electric conductivity of glasses. At the 7th meeting, 6 reports deal with glasses as semiconductors, 9 with the behavior of glasses and the influence of radiation and 4 reports with technical properties of glasses. A. A. Kalyanov, T. V. Molonova and G. P. Savchenko reported on the optical absorption in a number of binary chalcogenide systems. T. V. Molonova, T. F. Maslova and G. P. Savchenko reported on the electron conductivity of chalcogenide glasses. L. A. Slobodkin, V. A. Porokhina, "Radioisotopic Investigation of the Structure of Various Alkalio-Chalcogenides". V. V. Parasov and V. A. Ponomarev reported on the chain structure of the various sulfides determined by them with autoradiometric measurements. L. P. Astrov reported on structure and properties of ferric boron glasses and

Vitreous Semiconductors<sup>2</sup> VIII. The Optical Properties of Thallium, Arsenous, and Antimonious Chalcogenide Glasses<sup>6</sup>

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 4, pp 637-643

TEXT: The systems (Tl - As- Sb) - (S - Se - Te) form semiconductive glasses in a wide range (Fig. 1). These glasses can be penetrated by infrared light up to about 60 to 80%. In this paper, absorption spectra of 35 binary and two quaternary glasses are studied between  $\sim 1$  and  $18 \mu$ . The samples were prepared by fusion or pressing. Absorption depends, to some extent, on the mode of preparation method, as was shown by tests performed with  $As_2S_3$  (Fig. 2). The following systems were studied (some of the absorption curves are depicted):  $As_2S_3$  -  $As_2Se_3$ , five compounds (Fig. 3);  $As_2Se_3$  -  $As_2Te_3$ , ten compounds (Fig. 4);  $As_2Se_3$  -  $Tl_2Se$ , two compounds (Fig. 4);  $As_2Se_3$  -  $Sb_2Se_3$ , three compounds (Fig. 4);  $As_2S_3$  -  $As_2Te_3$ , two compounds (Fig. 6);  $As_2S_3$  -  $Tl_2S$ , two compounds (Fig. 6);  $As_2S_3$  -  $Sb_2S_3$ , two compounds (Fig. 6).

TITLE: Absorption spectra of glasses of the  $\text{As}_2\text{S}_3\text{-As}_2\text{Se}_3$   
system

PERIODICAL: Optika i spektroskopiya, v.12, no.2, 1962, 275-277

TEXT: The purpose of this work was to extend the study of the absorption spectra of the above system to the region of  $25 \mu$ , so as to determine the wavelengths of all the absorption bands. The glasses were compounded according to the method given previously (Ref.4: B.T. Kolomiyets, N.A. Goryunova, ZhTF, 25, 1955, 984; B.T. Kolomiyets, N.A. Goryunova, V.P. Shilo, Tr. III Vsesoyuzn. soveshch. po stekloobrazn. sost. (Proceedings of the 3rd Conference on vitreous state) L., 1959). The following were prepared:  $\text{As}_2\text{S}_3$ ;  $5\text{As}_2\text{S}_3\text{-As}_2\text{Se}_3$ ;  $2\text{As}_2\text{S}_3\text{-As}_2\text{Se}_3$ ;  $\text{As}_2\text{S}_3\text{-As}_2\text{Se}_3$ ;  $\text{As}_2\text{S}_3\cdot 2\text{As}_2\text{Se}_3$ ;  $\text{As}_2\text{S}_3\cdot 5\text{As}_2\text{Se}_3$ ;  $\text{As}_2\text{Se}_3$ . Disc-shaped samples 20 mm in diameter and 0.15-3.0 mm thick were cut out, ground and

polished. Transmission spectra were measured on spectrophotometers C $\phi$ -4 (SF-4) (0.5-1.2  $\mu$ ); ИКС-14 (IKS-14) (0.8-18.0  $\mu$ ); and Zeiss UR-10 (2-25  $\mu$ ). In the region of 1-18  $\mu$ , the authors found certain discrepancies between their data for the absolute transmittivity and the position and depth of the strongest absorption bands, and those given in previous papers (Refs. 1 and 2: Proc. of the 3rd Conference on vitreous state, L., 1959). In the long wavelength region all the glasses had their absorption bands beyond  $\lambda = 25 \mu$ , and hence could not be determined accurately. Optical absorption curves for  $As_2S_3$ ;  $As_2S_3 \cdot As_2Se_3$ ; and  $As_2Se_3$  were given. Some of the absorption bands were attributed to traces of  $As_2O_3$ , and others to the so far unidentified contaminants. There are 2 figures and 2 tables.

Abs Jour : Referat Zhur - Khimiya, No 6, 1957, 18559

Author : P.S. Shantarovich, B.V. Pavlov.  
Title : Dissociation Mechanism of Methane.

Orig Pub : Zh. fiz. khimii, 1956, 30, No 4, 811-820

Abstract : The kinetics of the thermal homogeneous dissociation of CH<sub>4</sub> at 850 to 1000° was studied. If the transformation depth was not great (up to 3%), the dissociation proceeds according to the law:  $w = k / [CH_4]^1$ , where  $k = 4.28 \times 10^{12} \exp(-35000/RT) \text{ sec}^{-1}$ . In case of great transformation depths, self-braking is observed, which is caused by the inhibiting influence of H<sub>2</sub> forming at the dissociation. The authors propose and analyse the chain scheme of CH<sub>4</sub> dissociation in detail. It is shown that the found effective energy of the activation of the gross process is the actual activation energy of the reaction CH<sub>3</sub> → CH<sub>2</sub> + H as a limiting stage of the chain dissociation.

Some characteristics of the discharge in the mixture of mercury and neon. G. M. Mel'shev and B. V. Pavlov  
-Vestnik Leningrad. Univ. 12, No. 16, Ser. Fiz., Khim. No. 3,  
32-40(1957). - Elec. and optical characteristics of d-c discharges in the mixt. of Ne and Hg vapors were studied by the Langmuir method of probes. The character of luminescence of the mixt. along the pos. column of the discharge was examed visually and with a spectrograph. The expts. were made on Hg-Ne mixts. at Hg pressures of about  $10^{-3}$  mm. Hg and Ne pressures from  $10^{-3}$  mg. Hg to 1 mm. Hg with discharge current intensities from 100 to 400.

The comparison of the results shows that with change in character of luminescence the electron temp. changes. The increase of the electron temp. at the anode in the sphere of the bright luminescence of Ne can be explained by its higher concn. in comparison to the cathode part of thydischarge. A. Libacký

AUTHORS: Shantarovich, P. S., Pavlov, B. V.

TITLE: Thermal Cracking of Methane //

PERIODICAL: Zhurnal fizicheskoy khimii, 1960, Vol. 34, No. 5,  
pp. 960-965

TEXT: The authors investigated the kinetics of the initial stage of thermal methane cracking at 1200-1400°C, a methane pressure of from 0.2 to 3.4 torr, and contact times in an interval of from  $10^{-3}$  to  $10^{-2}$  sec. Experiments were made in a helium current, and crackings were performed in small porcelain tubes (Tables 1-2, results) and small porcelain tubes coated with carbon black (Tables 3-6). Results show that a heterogeneous self-accelerated reaction takes place. The self-acceleration of the reaction is apparently caused by the decomposition of the methyl radical  $\text{CH}_3 \rightarrow \text{CH}_2 + \text{H}$ , which occurs on the surface. It is quite possible that the  $\text{CH}_2$  radical reacts with  $\text{CH}_4$  and does not

Action of phenamine on the higher nervous activity  
in the dog. B. V. Pavlov (Pavlov Physiol. Inst., Acad. #3  
Sci. U.S.S.R.) *Zh. Fiziol. Znaniy* 50: 271-82 (1980). Feeding  
0.0025-0.5 mg./kg. phenamine 25-60 mins. before the  
expts., in which noises, light, or touch stimuli were used  
for investigation of reflex activity in dogs, showed that  
0.05 mg. dosage gives optimum results in dogs with a weak  
nervous organization, while max. doses are best for the  
better organized animals. These doses gave significant  
increase of conditioned salivary reflexes. The latent  
period was shortened in all cases. Under the action of  
the drug dogs which were normally restless in soundproof  
boxes became quiet. Pulse rate usually rose, as did res-  
piration. Frequent repetition of the drug eventually  
led to sharp reflex decline and refusal of food. G. M. K.

Title : Concerning the work of the Leningrad Branch of the All-Union Society of Physiologists, Biochemists, and Pharmacologists during 1953  
Periodical : Fiziol. zhur. 40, 383-386, May/Jun 1954  
Abstract : The activity of the Leningrad Society of physiologists, biochemists and pharmacologists, during 1953, ranged from discussion of physiological teachings of I. P. Pavlov to dissemination of political information. During 1953 the society held 52 meetings at which 134 scientific reports were read. The Society is divided into 5 sections: physiology, biochemistry, pharmacology and toxicology, labor physiology and physical education, and physiology of agricultural animals. The society is presently mobilizing all its resources to carry out the orders of the September Plenum of the Central Committee, CPSU, and the resolutions of the joint session of the Academy of Sciences USSR, and Academy of Medical Sciences USSR.

Title : On the question of interaction between the first and second signal systems during the somnambulistic phase of hypnosis. Report II.

Periodical : Zhur. vys. nerv. deyat., 5, 11-18, Jan/Feb 1955

Abstract : The aim of this report is to clarify some peculiarities of bioelectrical activity of the brain (in healthy adults) during the somnambulistic phase of hypnosis in response to action of positive and inhibitive direct sound, light, and verbal stimuli. A limited focus of intensive excitation becomes formed in the second signal system during the somnambulistic phase of hypnosis. This arises as result of the simultaneous action of verbal and direct stimuli which are opposite in significance (one positive and one negative). These symptoms are connected, apparently, with the inductive inhibition of temporary connections in the first signal system. Five Soviet and six non-Soviet references. Diagrams.

"Changes Arising in the Higher Nervous Activity of Dogs Under the Influence of Irradiation by Roentgen Rays of the Cervical Section of the Vegetative Nervous System," by F. P. Mayorov, B. V. Pavlov, and N. Ya. Kipatova, Laboratory of Physiology and Pathology of Higher Nervous Activity (head, F. P. Mayorov), Trudy Instituta Fiziologii imeni I. P. Pavlova (Works of the Institute of Physiology imeni I. P. Pavlov), Moscow-Leningrad, Publishing House of the Academy of Sciences USSR, Vol 5, 1956, pp 79-102

Tests were conducted on five dogs in an effort to explain the influence of repeated irradiation by large doses of X rays (6,000 and 8,000 r) of the neck of: (1) intact dogs, (2) dogs with both superior cervical sympathetic ganglia removed, and (3) dogs with splanchnic nerves removed on both sides. The method used was that of salivary secretion.

Sum 1305

PAVLOV, B. K.

Results proved that irradiation of the neck by X rays at the site of the distribution of superior cervical sympathetic ganglia caused different changes in the higher nervous activity of intact and partially sympathectomized dogs. Thus: (1) In intact dogs there was a strong reduction in the value of conditioned and unconditioned reflexes, and these changes were of an irreversible nature for a long time. In certain cases hypnotic phases appeared which continued up to 3 weeks. (2) Irradiation by similar doses (6,000 and 8,000 r) of the neck of dogs who had undergone removal of the superior cervical sympathetic ganglia and those with severed splanchnic nerves caused in some cases a significant and prolonged rise of positive conditioned reflexes and in others their fall.

Histological changes in internal organs are described.

TITLE: Along Pavlov's path

PERIODICAL: Priroda, no. 1, 1961, 24-33

TEXT: This very general article reviews present research into the higher nervous activity of man and animals. Specific breakthroughs or data collected during previous Soviet manned space flights are not mentioned. It is concluded that many problems of the higher nervous activity are still unsolved, above all the intimate nature of cortical excitation and inhibition, the mechanism and localization of the switching of temporary connections in the brain, the cortical-subcortical interrelations, and the regularities of the evolution of the higher nervous activity. A new approach is required for studying physiological processes on which the higher nervous activity and abstract thinking are based. Future manned space flights will help in studying factors affecting the state of the higher nervous activity

SOURCE: Optiko-mekhanicheskaya promyshlennost', no. 7, 1966, 48-50

TOPIC TAGS: glass property, arsenic compound, selenido, oxygen, absorption spectrum, light absorption, chemical purity

ABSTRACT: In view of the influence of the purity of the initial materials on the character of the absorption spectra of various glasses, the authors investigated the absorption of glass-like As<sub>2</sub>Se<sub>3</sub> in the spectral region 2 -- 18  $\mu$  at different purity of the initial material and under different synthesis conditions, for the purpose of separating the intrinsic absorption bands of the material from the bands due to various contaminations. The synthesis was carried by procedures described earlier (ZhTF v. 28, 1958, no. 5, 981). The measurements were with a double-beam infrared spectrophotometer (IKS-14) operating in the 0.8 -- 18  $\mu$  range. The

TITLE: Strip power dividers

SOURCE: Leningrad. Politekhnicheskiy institut. Trudy, no. 255,  
1965. Radiotektronika (Radio electronics), 67-69

TOPIC TAGS: power divider, strip transmission line, microstrip

ABSTRACT: Strip-type exponential power dividers intended for supplying r-f power to multielement antennas are briefly described. Ratios  $l/\lambda$  for various  $w_2/w_1$  and TW ratios are tabulated; here  $l$  is the exponential-conductor length,  $\lambda$  is the wavelength,  $w_2$  and  $w_1$  are the terminal impedances of the divider. Curves of amplitude distribution over the output cables and of TW ratio within 500—700 Mc are presented. The above divider has been for division ratios up to 20. For higher ratios, a combination of ten strip exponential dividers arranged circularly and a strip (or coaxial) transformer is suggested. Orig. art. has: 4 figures, 1 formula, and 1 table. [03]

TITLE:

Polarographic Investigation of the Complex Compounds of Trivalent Antimony in Solutions of Sodium Fluoride (Polyarograficheskoye issledovaniye kompleksnykh soyedineniy trivalentnoy sur'my v rastvorakh fторistogo natriya)

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1958, Vol 3, Nr 9, pp 2099-2108  
(UCSR)

ABSTRACT:

The complex compounds of trivalent antimony in solutions of sodium fluoride were investigated polarographically. For the purpose of determining the character, the type and the behaviour of the obtained antimony complexes in solutions of sodium fluoride, similar investigations were carried out according to two methods. The dependence of the potential step  $E_{1/2}$  on the pH-value of the solution was investigated at a constant concentration of the fluorine-ion; at constant pH-value of the solution the modification of the potential step in dependence on the concentration of the fluorine-ion was investigated. The results showed that in acid medium antimony with fluorine ion forms the stable complex  $[SbF_6]^{3-}$  with the stability constant

Card 1/3

SOV/78-3-9-15/38

Polarographic Investigation of the Complex Compounds of Trivalent Antimony  
in Solutions of Sodium Fluoride

$K_c = 10^{-36}$ . The potential step of the antimony complex is obtained in the potential range of from -300 to -900 mV. In the neutral and weakly alkaline medium the antimony-fluorine complex hydrolyzes gradually under the formation of unstable oxy-complexes, which probably have the following composition:  $[\text{Sb}(\text{OH}_2)_{p-1}(\text{OH})]^{2+}$ ,  $[\text{Sb}(\text{OH}_2)_{p-2}(\text{OH})_2]^+$  and  $[\text{Sb}(\text{OH}_2)_{p-3}(\text{OH})_3]$ . The final product of the hydrolysis of the antimony-fluorine complex is a deposit of  $\text{Sb}(\text{OH})_3$ . The polarographic waves of the oxy-complexes of antimony by no means can be used for analytical purposes. In highly alkaline medium a dissolution of  $\text{Sb}(\text{OH})_3$  occurs with the formation of the salt of the meta-antimonic acid at the same time. This salt has a cathode step  $E_{1/2} = 1,270$  V and an anode step  $E_{1/2} = 0,355$  V. The solutions obtained of the antimony-fluorine complex in a highly alkaline solution of sodium fluoride are used for quantitative analyses. The mechanism of hydrolysis of the complex  $[\text{SbF}_6]^{3-}$  was

POLAROGRAPHY

AUTHORS: Pavlov, D., and Lazarov, D. 20-1-29/58

TITLE: A Polarographic Investigation of the Complexes of Trivalent Antimony in Sodium-Fluoride Solutions. (Polyarograficheskoye issledovaniye kompleksov trekhvalentnoy sot'my v rastvorakh fторistogo natriya).

PERIODICAL: Doklady AN SSSR, 1958, Vol. 118, Nr 1, pp. 103-106(USSR).

ABSTRACT: The authors give the polarographic characteristic of antimony in fluoride solutions according to reference 1. They made the present investigation in view of this information and in connection with the fact that the fluorine ion possesses a small radius and forms stable complexes with several ions. The investigations were in parallel performed with 2 methods: 1) the dependence of the variation of  $\eta_{1/2}$  on the pH of the solution was studied at a constant total concentration of  $F^-$ ; 2) the dependence of the variation of  $\eta_{1/3}$  on the  $F^-$ -concentration was studied at a constant pH. Both test series showed that the  $Sb^{+++}$  are in different manners bound in the complexes in the entire range of pH-values from 1 to 14. At pH-values of 1 to 3 the  $Sb^{+++}$  are free; at pH from 3 to 6 a fluorine complex develops which decomposes in the pH-range of from 6 to 8. The complexes forming above pH 8 do not contain any  $F^-$ ; at pH 13 an anode-wave and a cathode-wave become

Card 1/4

A Polarographic Investigation of the Complexes of Trivalent Antimony in Sodium-Fluoride Solutions. 20-1-29/58

visible on the polarogram. Based on these studies the authors divided the entire range of pH-values into 3 parts: Sb<sup>+++</sup>-complexes in acid NaF-solutions. Results of some test series are given in coordinates  $\pi_{1/2}$ , pH on Figure 1. An equation for the total concentration of fluorine ions is derived. Figure 2 records the dependence of  $\pi_{1/2}$  on  $-\lg a_F$ . An equation for the straight (figure 2) is given. The constant of instability  $K_c = 10^{36-}$  ("konstanta nestoykosti"). The complex of the type  $[SbF_6]^-$  is only stable until the ratio  $a_{OH^-} / a_F = 10^{-8}$ , i. e. until the peak of the curves  $\pi_{1/2}$ , pH, (figure 1). Sb<sup>+++</sup>-complexes in the medium alkaline range. This range begins with the disintegration of the  $SbF_6^-$ -complex and ends in the alkaline range (up to pH 11-12). In this range several complexes develop in an unstable form. The pH-values in the range 5-8 yielded no unique results for  $\pi_{1/2}$ , but a low point of these curves (figure 1) was in all cases observed. In the pH-range of from 8 to 11 two waves are noticed: the groundwave II and the preliminary wave I (figure 3). The preliminary wave disappears when the solution is heated or left standing.

Card 2/4

## A Polarographic Investigation of the Complexes of Trivalent Antimony in Sodium-Fluoride Solutions.

20-1-29/58

It is independent on the  $F^-$ -concentration and is in pH-modifications displaced toward the more negative values according to the equation  $\eta_{1/2} = 1,100 - 0,060 \lg a_{OH^-}$  (figure 4,I). The tests showed that  $F^-, Cl^-$  and  $NH_3$  do not participate in the complex. Thus a hydroxycomplex

$[Sb(OH_2)_pNH_3(OH)_3]^-$  may be assumed which on standing splits off water and precipitates  $Sb(OH)_3$ . Its constant of instability  $K_c = 2,7 \cdot 10^{-14}$ .

The main wave also loses in height, but much slower. In this connection the pH of the solutions also changes.  $\eta_{1/2}$  is independent on the concentration of  $F^-$ ,  $Cl^-$  and  $NH_3$  and shifts toward more negative values according to the equation:  $\eta_{1/2} = -1,50 - 0,020 \lg a_{OH^-}$  (figure 4,II). From this the following complex may be assumed:

$[Sb(OH_2)_pOH(OH)]^{++}$ ,  $K_c = 10^{-16}$ . Behavior of  $Sb^{+++}$  in strongly alkaline media. This range begins with the dissolution of the precipitation  $Sb(OH)_3$ . In strongly alkaline solutions with pH 14 a well marked cathode-wave develops when  $\eta_{1/2} = -1,270$  v and an anode-wave when

in Sodium-Fluoride Solutions.

" $\frac{1}{2}$ " = 0,355 v. The latter is deformed by a peculiar maximum. The height ratio of the two waves is 3 : 2 (figure 3). Conversion mechanism of individual complex  $Sb^{+++}$  forms at variations of the pH of the solution. In a strongly acid medium (up to pH 2-3) the F ions are bound as HF and  $HF_2^-$ , whereas  $Sb^{+++}$  are free. The activity of F increases with increasing pH and conditions for the formation of  $/SbF_6/^{---}$  are created. Its hydrolysis (see above) leads to the formation of an unstable complex  $/Sb(OH_2)_p(OH)/^{++}$  which decomposes. The hydro- and hydroxy-complexes are unstable and may be considered intermediate forms of the hydrolysis of  $/SbF_6/^{---}$ . There are 4 figures, and 4 references, 1 of which is Slavic.

REGARDING

D. L. COV and K. [unclear], several documents have been submitted to the  
[unclear] (General Committee of the Central Committee of the CPSU) by the [unclear]  
[unclear], [unclear].

1. General and Specific Methods for Determination of Sugars in the Blood  
and Other Biological Materials.

2. A. V. Mikhalev & N. N. Sipacheva, "Zhur. Anal. Khim.", 1972, No. 12.

According to these documents, detailed description of the methods will be  
published after the determination of the so-called sugar. Two tables  
are included in the documents.

 TITLE : Adsorption of Arsine by Potassium Iodate  
         Solution and Its Use in Polarographic  
         Determination of Arsenic.  
 ORIG. PUB. : Izv. K. i. m. in-t. B"lg. AN, 1958, 6, 33-43  
 ABSTRACT : A method has been developed for determination of As, based on reduction of As to AsH<sub>3</sub>, absorption of AsH<sub>3</sub> by standard solution of KIO<sub>3</sub>, and polarography of unreacted IO<sub>3</sub>. The sample is treated with a current of H<sub>2</sub> (Zn in 30% H<sub>2</sub>SO<sub>4</sub>). The evolved AsH<sub>3</sub> is absorbed in 20 ml of a mixture having the composition: 2 N H<sub>2</sub>SO<sub>4</sub>, 0.00755 N KIO<sub>3</sub> and 0.00057 M Ce(SO<sub>4</sub>)<sub>2</sub>; completeness of absorption is checked with 10% ammoniacal solution of AgNO<sub>3</sub> (duration of absorption 30-40 minutes). Ce(SO<sub>4</sub>)<sub>2</sub> catalyzes the reaction 8HIO<sub>3</sub>+5AsH<sub>3</sub>=5H<sub>3</sub>AsO<sub>4</sub>+4I<sub>2</sub>+4H<sub>2</sub>O; at the same time there takes place in the system the reaction: 2I<sub>2</sub>+IO<sub>3</sub>+6H<sup>+</sup>=6I<sup>+</sup>+3H<sub>2</sub>O, and it is proposed to add to absorption mixture, as
